Mapping Cone Construction

Sunil Rana

Abstract

Objective of this talk is to attach a long exact sequence to a map of cochain complexes. For a map $f^* : L^* \to M^*$ of cochain complexes we shall define its mapping cone $Mc(f^*)$. We shall then construct a short exact sequence $0 \to M^* \to Mc(f^*) \to L^*[1] \to 0$ and get the long exact sequence using the snake lemma. We shall also motivate the definition of mapping cone of a chain complex map from the definition of the mapping cone of a map of topological spaces.
