Why NCG in Physics ?

Spectral theory and quantum physics

The question :

Why NCG in Physics ?

Spectral theory and quantum physics

Classical mechanics : In special relativity, notion of magnetic field :

$$x \in M = \mathbb{R}^4, \psi(x) \in \mathbb{R}^3$$

Why NCG in Physics ?

Spectral theory and quantum physics

Classical mechanics : In special relativity, notion of magnetic field :

$$x \in M = \mathbb{R}^4, \psi(x) \in \mathbb{R}^3$$

But Einstein (1912-1915) :

gravitational field

Equation of motion for matter in the field

Why NCG in Physics ?

Spectral theory and quantum physics

Classical mechanics : In special relativity, notion of magnetic field :

$$x \in M = \mathbb{R}^4, \psi(x) \in \mathbb{R}^3$$

But Enstein (1912-1915) :

gravitational field

Equation of motion for matter in the field

Problems with

physical meaning of coordinates x^μ

Equation of field

The question :

Assume general covariance, then

given the tetrad-field $e_{\mu}^I(x)$: a solution,

(I for inertial reference frame)

after a diffeomorphism ϕ (active or passive),

$$e_{\nu}^{\prime I}(\phi(x)) = \frac{\partial x^{\mu}}{\partial \phi(x)^{\nu}} e_{\mu}^I(x) \quad \text{is another solution}$$

What about Invariance of laws in all reference frames ?

The question :

Assume general covariance, then

given the tetrad-field $e_{\mu}^I(x)$: a solution,

(I for inertial reference frame)

after a diffeomorphism ϕ (active or passive),

$$e_{\nu}^{I'}(\phi(x)) = \frac{\partial x^{\mu}}{\partial \phi(x)^{\nu}} e_{\mu}^I(x) \quad \text{is another solution}$$

What about Invariance of laws in all reference frames ?

When Relativity became General, points disappeared !

Only fields on fields exist : NO GIVEN SPACETIME.

Moral : Quantum forces and GR \longrightarrow Spectral approach

The question :

Another argument :

Observables and notion of infinitesimals

Cannot coexist in classical spacetime.

Can coexist in algebraic setting

Infinitesimal are just compact operators !

The question :

Another argument :

Observables and notion of infinitesimals

Cannot coexist in classical spacetime.

Can coexist in algebraic setting

Infinitesimal are just compact operators !

Another argument :

$\sum_{n \in \mathbb{N}^*} \frac{1}{n}$ diverges logarithmically like $\int \frac{1}{r}$

Dixmier trace is not a gadget

The spectral action :

$$(A, \mathcal{H}, \mathcal{D})$$

dimension d

- J , reality operator (Tomita) \longleftrightarrow charge conjugation
- $\chi \longleftrightarrow$ chirality

The spectral action :

$$(A, \mathcal{H}, \mathcal{D})$$

dimension d

- J , reality operator (Tomita) \longleftrightarrow charge conjugation
- $\chi \longleftrightarrow$ chirality

What could be an action ?

$$\text{Manifolds : } \int_M \text{scal}(x) \sqrt{\det(g_x)} dx$$

The spectral action :

$$(A, \mathcal{H}, \mathcal{D})$$

dimension d

- J , reality operator (Tomita) \longleftrightarrow charge conjugation
- $\chi \longleftrightarrow$ chirality

What could be an action ?

Manifolds : $\int_M \text{scal}(x) \sqrt{\det(g_x)} dx$

$$\mathcal{S}(\mathcal{D}, \Lambda, \Phi) := \text{Tr} (\Phi(\mathcal{D}/\Lambda))$$

$\Phi > 0$ even function

($\Phi =$ step function, number of eigenvalues of $\mathcal{D}^2 < \Lambda^2$)

Computation of $\mathcal{S}(\mathcal{D}, A, \Phi)$

Inner fluctuations : A one-form in $\Omega_{\mathcal{D}}^1(\mathcal{A})$

$$A = \sum_{finite} a_i [\mathcal{D}, b_i], \quad a_i, b_i \in \mathcal{A}$$

$$\begin{aligned} \mathcal{D} &\longmapsto \mathcal{D}_A := \mathcal{D} + \tilde{A}, \\ \tilde{A} &:= A + \epsilon JAJ^{-1} \end{aligned}$$

$\epsilon = \pm 1$ defined by $\mathcal{D}J = \epsilon J\mathcal{D}$.

Commutative Case :

$$\mathcal{D}_A = \mathcal{D}, \quad \forall A = A^*$$

Computation of $\mathcal{S}(\mathcal{D}, A, \phi)$

Depends only on the spectrum

Gauge invariant

- 1 Heat Kernel Approach :

Computation of $\mathcal{S}(\mathcal{D}, A, \Phi)$

Depends only on the spectrum
Gauge invariant

① Heat Kernel Approach :

Constraints on Φ :

- Step function not allowed !
- Distributional approach (Estrada–Gracia–Bondia–Varilly)
- $\Phi \in \mathcal{S}(\mathbb{R}^+)$ is a Laplace transform of

$\hat{\psi} \in \mathcal{S}(\mathbb{R}^+) = \{g \in \mathcal{S}(\mathbb{R}) : g(x) = 0, x \leq 0\}$ (Nest–Vogt–Werner)

Then Φ has analytic extension on the right complex plane :

$$\Phi(z) = (-1)^m \int_0^\infty e^{-tz} t^m \hat{\psi}(t) dt, \quad \operatorname{Re}(z) > 0.$$

$$\operatorname{Tr}(\Phi(\mathcal{D}/\Lambda)) = \sum_{k=0}^d \Phi_k a_k \Lambda^{d-k} + \mathcal{O}(\Lambda^{-1})$$

Computation of $\mathcal{S}(\mathcal{D}, A, \Phi)$

$$\mathrm{Tr}(\Phi(\mathcal{D}/\Lambda)) = \sum_{k=0}^d \Phi_k a_k \Lambda^{d-k} + \mathcal{O}(\Lambda^{-1})$$

a_k : Seeley-De Witt coefficients :

on a manifold, $e^{-t\mathcal{D}^2}$ is tracial with smooth Schwartz kernel $k_t(x, y)$

$$k_t(x, y) \simeq_{t \rightarrow 0} \frac{1}{(4\pi t)^{d/2}} \sqrt{\det(g_x)} \sum_{n \geq 0} k_n(x, y) t^n e^{-d(x, y)^2/4t}$$

$$\begin{aligned} \Phi_k &= \frac{1}{\Gamma(m-k)} \int_0^\infty \Phi(t) t^{m-1-k} dt, \quad k = 0, 1, \dots, m-1 \\ &= (-1)^k \phi^{(k-m)}(0), \quad k = m, \dots, d. \end{aligned}$$

$m = d/2$

Different entrance points :

Heat kernels,

Zeta functions,

Dixmier traces

Computation of $\mathcal{S}(\mathcal{D}, A, \phi)$

- ② Zeta function approach

Computation of $\mathcal{S}(\mathcal{D}, A, \Phi)$

2 Zeta function approach

• **Commutative case** : Pseudodifferential operators

$P \in \Psi DO$ of order q

$$s \in \mathbb{C} \longrightarrow \zeta_P(s) = \text{Tr}(P|\mathcal{D}|^{-s})$$

is holomorphic for $\text{Re}(s) > q + d$,

with at most poles at integers $k \leq q + d$.

Leading residue is

$$\text{Res}_{s=d+q} \zeta_P(s) = c_1 \text{Tr}_{Dix}(P) = c_2 \int_{S^*(M)} \sigma_P$$

(Guillemin, Wodzicki, ..., with $\mathcal{D}^2 = \Delta$)

Computation of $\mathcal{S}(\mathcal{D}, A, \Phi)$

- **Abstract case** : Subleading residues

$(\mathcal{A}, \mathcal{H}, \mathcal{D})$ dim d :

$$0 < \text{Tr}_{\text{Dix}}(a|\mathcal{D}|^{-d}) < \infty, \quad \forall a \in \mathcal{A}^+$$

When \mathcal{D} non invertible,

$$\mathcal{D} \longleftrightarrow \mathcal{D} + P_0, \quad P_0 : \text{Proj. on Ker } \mathcal{D}$$

Construction of ΨDO :

$$OP^0 = \{ T : t \rightarrow e^{it|\mathcal{D}|} T e^{-it|\mathcal{D}|} \in C^\infty(\mathbb{R}, \mathcal{B}(\mathcal{H})) \}$$

$$OP^\alpha = \{ T : T|\mathcal{D}|^{-\alpha} \in OP^0 \}, \quad \alpha \in \mathbb{R}$$

Computation of $\mathcal{S}(\mathcal{D}, A, \Phi)$

Definition : $T \in \Psi DO$

$\exists d \in \mathbb{Z}$, such that $\forall N \in \mathbb{N}$,

$$\exists p \in \mathbb{N}_0$$

$$\exists P \in \text{Alg}\{A, JAJ^{-1}, \mathcal{D}, |\mathcal{D}|\}$$

$$\exists R \in OP^{-N}$$

$$P|\mathcal{D}|^{-2p} \in OP^d$$

$$T = P|\mathcal{D}|^{-2p} + R$$

(p, P, R depend on N).

Idea : work modulo large N .

Computation of $\mathcal{S}(\mathcal{D}, \mathcal{A}, \Phi)$

Properties :

- ΨDO is an algebra.
- $f T := \text{Res}_{s=0} \zeta_{\mathcal{D}}^T(s) = \text{Res}_{s=0} \text{Tr} (T |\mathcal{D}|^{-s}), \quad T \in \Psi DO$
- $a|\mathcal{D}|^{-(d+\epsilon)} \in \mathcal{L}^1(\mathcal{H}), \forall a \in \mathcal{A}, \forall \epsilon > 0$
 f is a trace on ΨDO .

3 Spectrum dimension

$$Sd(\mathcal{A}, \mathcal{H}, \mathcal{D}) := \{ \text{poles of } \text{Tr} (T |\mathcal{D}|^{-s}) : T \in \Psi DO \}$$

Example : M compact spin^c Riemannian manifold of dimension d
 $\mathcal{A} = C^\infty(M), \mathcal{H} = L^2(\text{Spineurs}), \mathcal{D} = -i\gamma^\mu \partial_\mu$

$$Sd(\mathcal{A}, \mathcal{H}, \mathcal{D}) = \{ d - k : k \in \mathbb{N}_0 \}.$$

Computation of $\mathcal{S}(\mathcal{D}, A, \Phi)$

Remark :

Carey–Rennie–Sedaev–Sukochev (2006) :

$0 \leq T \in \mathcal{B}(\mathcal{H})$, $T^s \in \mathcal{L}^1(\mathcal{H})$ for all $s > 1$, then, if $I = \lim_{\epsilon \rightarrow 0} \epsilon \operatorname{Tr}(T^{1+\epsilon})$ exists, then $\operatorname{Tr}_{\text{Dix}}(T) = I$

Conclusion :

$$\begin{aligned}\mathcal{S}(\mathcal{D}_A, \Phi, \Lambda) &= \sum_{0 < k \in Sd^+} \Phi_k \Lambda^k \int |\mathcal{D}_A|^{-k} + \Phi(0) \zeta_{\mathcal{D}_A}(0) + \mathcal{O}(\Lambda^{-1}) \\ &= ?\end{aligned}$$

NC-torus of dimension d

$$\mathcal{A} := \left\{ a = \sum_{k \in \mathbb{Z}^d} a_k U_k : (a_k)_k \in \mathcal{S}(\mathbb{Z}^d) \right\}$$

$$U_k U_q = e^{-ik \cdot \Theta q} U_q U_k$$

Θ skew symmetric real $d \times d$ -matrix.

U_k are unitaries

$\tau(a) := a_0$ is a **trace** giving by GNS \mathcal{H}_τ

$$\mathcal{H} := \mathcal{H}_\tau \otimes \mathbb{C}^{2^m}, \quad m = \lfloor d/2 \rfloor$$

Natural derivations : $\delta_\mu, \quad \mu \in \{1, \dots, d\}$

$$\delta_\mu U_k := ik_\mu U_k$$

Dirac operator

$$\mathcal{D} := -i\delta_\mu \otimes \gamma^\mu$$

Reality operator : $J_0(a) := a^*$, define C by

$$C\gamma^\mu = -\epsilon\gamma^\mu C, \quad \epsilon = \pm 1, \quad C^2 = \pm 1$$

$$J = J_0 \otimes C$$

$(\mathcal{A}, \mathcal{H}, \mathcal{D}, J)$ is a regular spectral triple

Hermitian one-form $A := \sum_i a_i [\mathcal{D}, b_i]$, $a_i, b_i \in \mathcal{A}$

$$\begin{aligned}\mathcal{D}_A &= \mathcal{D} + A + \epsilon J A J^{-1} \\ &= -i(\delta_\mu + L(A_\mu) - R(A_\mu)) \otimes \gamma^\mu, \quad A_\mu = -A_\mu^*\end{aligned}$$

Theorem (Essouabri-B.I.-Levy-Sitarz, J. Noncommut. Geom. 2008)

- 1) $\text{Sd}(\text{Nc-torus}) = \{d - k : k \in \mathbb{N}_0\}$ and all poles are simple.
- 2) $\zeta_D(0) = \dim \text{Ker}(\mathcal{D})$.

HIC SUNT DRACONES

TRUE if Θ is badly approximable :

Diophantine condition : $\exists u \in \mathbb{Z}^d, \exists \delta > 0$

$$|q \cdot \Theta u - p| > c|q|^{-\delta}, \quad \forall 0 \neq q \in \mathbb{Z}^d, \quad \forall p \in \mathbb{Z}$$

Such Θu 's have zero Lebesgue measure.

Due to J : Control holomorphy of Hurwitz–Epstein Zeta functions.

NC-torus of dimension d

Result :

$$s \in \mathbb{C} \rightarrow f_a(s) := \sum_{0 \neq k \in \mathbb{Z}^d} \frac{P(k)}{\|k\|^s} e^{i2\pi k \cdot a}$$

$a \in \mathbb{R}^d$, $P \in \mathbb{C}[x_1, \dots, x_d]$ homogeneous polynomial of degree p ,

$$\|k\| = \sqrt{k_1^2 + \dots + k_d^2}.$$

- When $a \in \mathbb{Z}^d$, f_a has meromorphic extension to \mathbb{C} .

f_a not entire $\iff \text{Res}_{s=d+p} f_a(s) = \int_{u \in S^{d-1}} P(u) dS(u) \neq 0$

- When $a \in \mathbb{R}^d \setminus \mathbb{Z}^d$, f_a has meromorphic extension to \mathbb{C} .

- When Θ is diophantine, for any $q > 0$,

$$g(s) := \sum_{l \in (\mathbb{Z}^d)^q} c(l) f_{\Theta(\sum_i l_i)}(s), \quad c(l) \in \mathcal{S}(\mathbb{Z}^d)^q$$

has only one pole on $s = d + p$ with

$$\text{Res}_{s=d+p} g(s) = c \int_{u \in S^{d-1}} P(u) dS(u)$$

NC-torus of dimension d

Examples :

$$\text{Res}_{s=0} \sum_{k \in \mathbb{Z}^2} \frac{k_i k_j}{\|k\|^{s+4}} = \delta_{i,j} \pi$$

$$\text{Res}_{s=0} \sum_{k \in \mathbb{Z}^4} \frac{k_i k_j k_l k_m}{\|k\|^{s+6}} = (\delta_{ij} \delta_{lm} + \delta_{il} \delta_{jm} + \delta_{im} \delta_{jl}) \frac{\pi^2}{12}$$

etc with more similar results ...

Appear in ζ -regularization, multiplicative anomaly, Casimir effect, ...

Chamseddine–Connes (2006) extended :

For any one-form A , the constant term in Λ

$$\begin{aligned} \zeta_{\mathcal{D}_A}(0) - \zeta_{\mathcal{D}}(0) &= - \int \log(1 + \tilde{A} \mathcal{D}^{-1}) \\ &= \sum_{k=1}^d \frac{(-1)^k}{k} \int (\tilde{A} \mathcal{D}^{-1})^k \end{aligned}$$

NC-torus of dimension d

Result

$d = 2$:

$$S(\mathcal{D}_A, \Lambda, \phi) = 4\pi \phi_2 \Lambda^2 + \mathcal{O}(\Lambda^{-2})$$

$d = 4$:

$$S(\mathcal{D}_A, \Lambda, \phi) = 8\pi^2 \phi_4 \Lambda^4 - \frac{4\pi^2}{3} \tau(F_{\mu\nu} F^{\mu\nu}) + \mathcal{O}(\Lambda^{-2})$$

More generally, $\forall d \geq 1$,

$$S(\mathcal{D}_A, \Lambda, \phi) = \sum_{k=0}^d \phi_{d-k} c_{d-k}(A) \Lambda^{d-k} + \mathcal{O}(\Lambda^{-1})$$

$c_{d-1}(A) = 0$, $c_{d-k}(A) = 0$ for k odd (d odd $\Rightarrow c_0(A) = 0$)

Conjecture : Noncommutative coefficients of $\mathcal{D} + \tilde{A} \simeq$ coefficients of $\mathcal{D} + A$ for the commutative torus

NC-torus of dimension d

Remarks :

- No tadpole here : $f \tilde{A} \mathcal{D}^{-1} = 0$
- For general spectral triples (with simple dimension spectrum)
 f can be defined with \mathcal{D} or $\mathcal{D}_A = \mathcal{D} + \tilde{A}$:

$$\int P = \text{Res}_{s=0} \text{Tr} (P |\mathcal{D}_A|^{-s}), \quad P \in \Psi DO$$

- Top term (cosmological term) : $f |\mathcal{D}_A|^{-d} = f |\mathcal{D}|^{-d}$
- Constant term depends on :
 $\dim \text{Ker} (\mathcal{D}_A) - \dim \text{Ker} (\mathcal{D})$

Beyond Diophantine condition

Case $d = 2$, $\Theta = \theta \begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$, $\theta \in \mathbb{R}$

Let $f : [1, \infty[\rightarrow]0, \infty[$, continuous, $x^2 f(x)$ non-increasing

$\mathcal{K}(f) := \{ \theta \in \mathbb{R} : |\theta - \frac{p}{q}| < f(q), \text{ for infinitely many rational numbers } \frac{p}{q} \}$

Such θ are termed f -approximable.

(Not valid for all rational $\frac{p}{q}$ since $(\theta q)_{q \geq 1}$ are dense in $[0, 1]$ when $\theta \notin \mathbb{Q}$)

Result (Jarnik 1953)

For each f , there exists an uncountable set $\mathcal{K}(f)$ of real numbers $\frac{1}{2\pi}\theta$, f -approximable but not $c f$ -approximable for any $0 < c < 1$.

$\mathcal{K}(f)$ has zero Lebesgue measure if $\sum_{q=1}^{\infty} q f(q)$ converges and full Lebesgue measure otherwise.

Consequences : Tuning f , $\exists a, b \in \mathcal{A}$ such that correction term

$$\text{Tr} (L(a) R(b) e^{-t\mathcal{D}^2}) - (\dots)_{\text{Dioph}}$$

- is not exponentially small
- is not $\mathcal{O}(\frac{1}{t})$ like for $\frac{1}{2\pi}\theta \in \mathbb{Q}$
- is of arbitrary order!

Extension to non-compact case

M non compact connected complete Riemannian spin^c manifold with bounded curvature and control of its heat kernel $K_t(\cdot, \cdot)$

$$\sup_{p \in M} \int_0^\infty t^k e^{-t} K_t(p, p) dt < \infty, \quad \forall k > \frac{d}{2} - 1$$

$$\sup_{p \in M} \int_m^\infty \frac{e^{-t}}{\sqrt{t}} K_t(p, p) dt < c m^{-(d-1)/2}, \quad \forall m \in [0, 1]$$

Valid :

- M has Ricci curvature bounded from below.
- Positive injectivity radius and control of isoperimetric constants of balls of a given radius.
- Bounded geometry.

M has a smooth isometric proper action α of \mathbb{R}^l

Example : **Moyal planes** $M = \mathbb{R}^{2n}$, $\alpha = \text{translation}$

$$f \star_{\hbar} g(x) := \int_{\mathbb{R}^{2n} \times \mathbb{R}^{2n}} f(x - \frac{\Theta}{\hbar} u) g(x - v) e^{-i u \cdot v} du dv$$

Extension to non-compact case

Result (Gayral, B.I. & Várilly, JFA 2006) : When $f \in C_c^\infty(M)$

$$\int L_f |\mathcal{D}|^{-d} = \int M_f |\mathcal{D}|^{-d} = c \int_M f$$

Remarks :

- When M is compact, α being proper must be periodic.
- When M is non compact, \mathcal{D} has a continuous spectrum but $L_f(\mathcal{D} - \lambda)^{-1}$ is compact.

Result (Gayral, B.I., Gracia-Bondía, Schücker & Várilly, CMP 2004) :

Moyal planes are spectral triples.

Spatial regularization

Choose $\rho \in \mathcal{A}$

$$\mathcal{S}(\mathcal{D}_A, \Lambda, \Phi, \rho) := \text{Tr}(\rho \Phi(\mathcal{D}/\Lambda)) \quad (1)$$

Result (Gayral, I., JMP 2005)

$\mathcal{S}(\mathcal{D}_A, \Lambda, \Phi, \rho)$ has same coefficients as before with

$$c_k(A) \longleftrightarrow \int_{\mathbb{R}^d} \rho(x) c_k(A)(x) dx$$

Remark :

(1) is not satisfactory : too many choices !

Chamseddine–Connes (2006) : **Dilaton field** ϕ

$$\mathcal{D} \longleftrightarrow e^{-\phi} \mathcal{D} e^{-\phi}, \quad \phi = \phi^* \in Z(\mathcal{A})$$

$$N(\Lambda) = \dim \{ \mathcal{D}^2 \leq \Lambda^2 \} \longleftrightarrow N(\phi) = \dim \{ \mathcal{D}^2 \leq \phi^2 \}$$

THE question

PART II

NOT

RIGHT

even

POSSIBLY

WRONG

Computation of $\mathcal{S}(\mathcal{D}_A, \Lambda, \Phi)$

Conclusion of part I :

$$\begin{aligned}\mathcal{S}(\mathcal{D}_A, \Phi, \Lambda) &= \sum_{0 < k \in Sd^+} \Phi_k \Lambda^k \int |\mathcal{D}_A|^{-k} + \Phi(0) \zeta_{\mathcal{D}_A}(0) + \mathcal{O}(\Lambda^{-1}) \\ &= ?\end{aligned}$$

LOCALITY : USUAL TRACE COMPUTED VIA RESIDUES!

Computation of $\mathcal{S}(\mathcal{D}_A, \Lambda, \Phi)$

$$\mathcal{S}(\mathcal{D}_A, \Phi, \Lambda) = \sum_{0 < k \in \mathbb{S}d^+} \Phi_k \Lambda^k \int |\mathcal{D}_A|^{-k} + \Phi(0) \zeta_{\mathcal{D}_A}(0) + \mathcal{O}(\Lambda^{-1}).$$

Only few examples :

Standard models : CHAMSEDDINE–CONNES–MARCOLLI,
KASTLER–B.I–SCHÜCKER–STEPHAN
GRACIA-BONDIA–VARILLY

Moyal planes : GAYRAL–B.I–VASSILEVICH

Noncommutative torus : ESSOUABRI–B.I–LEVY–SITARZ

Isospectral deformations of toric manifolds : GAYRAL–B.I–VARILLY

Moyal planes + gauge theory : GROSSE–WULKENHAAR

How to proceed ?

Hochschild cohomology approach

For $n \in \mathbb{N}^*$ and $a_i \in \mathcal{A}$, define

$$\phi_n(a_0, \dots, a_n) := \int a_0 [\mathcal{D}, a_1] \mathcal{D}^{-1} \cdots [\mathcal{D}, a_n] \mathcal{D}^{-1}.$$

$da := [\mathcal{D}, a]$. On the universal n -forms $\Omega_u^n(\mathcal{A})$

$$\int_{\phi_n} a_0 da_1 \cdots da_n := \phi_n(a_0, a_1, \dots, a_n).$$

$b - B$ bicomplex defined by Connes : b is the Hochschild coboundary map

$$\begin{aligned} b\phi(a_0, \dots, a_{n+1}) &:= \sum_{j=0}^n (-1)^j \phi(a_0, \dots, a_j a_{j+1}, \dots, a_{n+1}) \\ &\quad + (-1)^{n+1} \phi(a_{n+1} a_0, a_1, \dots, a_n), \\ B_0 \phi_n(a_0, a_1, \dots, a_{n-1}) &:= \phi_n(1, a_0, \dots, a_{n-1}). \end{aligned}$$

$B := NB_0$, where $N := 1 + \lambda + \dots + \lambda^n$ is the cyclic skewsymmetrizer on the n -cochains and $\lambda\phi(a_0, \dots, a_n) := (-1)^n \phi(a_n, a_0, \dots, a_{n-1})$.

Spectral action in 3-dimension

Result : If $(\mathcal{A}, \mathcal{D}, \mathcal{H})$ is a spectral triple of dimension 3, then

$$\begin{aligned} b\phi_1 &= -\phi_2, & b\phi_2 &= 0, & b\phi_3 &= 0, \\ B\phi_1 &= 0, & B\phi_2 &= 0, & B\phi_3 &= 3B_0\phi_3. \end{aligned}$$

Remark : When $X \in OP^{-3}$, in $\int X$ one can use $[\mathcal{D}^{-1}, \mathcal{A}] = 0$.

Spectral action in 3-dimension

Scale invariant term of spectral action

Chamseddine-Connes 2006

$$\zeta_{\mathcal{D}_A}(0) - \zeta_{\mathcal{D}}(0) = - \int AD^{-1} + \frac{1}{2} \int AD^{-1}AD^{-1} - \frac{1}{3} \int AD^{-1}AD^{-1}AD^{-1}.$$

For any spectral triple of dimension 3 and any one-form A ,

$$\begin{aligned} \zeta_{\mathcal{D}_A}(0) - \zeta_{\mathcal{D}}(0) &= -\frac{1}{2} \int_{N\phi_1} A + \frac{1}{2} \int_{\phi_2} (dA + A^2) - \frac{1}{2} \int_{\phi_3} (AdA + \frac{2}{3}A^3) \\ &\simeq \text{Tadpole} + \text{Y.M.} + \text{C.S. in dim 4.} \end{aligned}$$

$SU_q(2)$

Let G Galilean group, P Poincaré group

$\forall \epsilon > 0$, there exists $A_i, B_i, i \in \{1, \dots, 10\}$ basis in Lie algebras of G and P such that

$$\begin{aligned} [A_i, A_j] &=: C_{ij}^k A_k, & [B_i, B_j] &=: C'_{ij}{}^k B_k, \\ |C_{ij}^k - C'_{ij}{}^k| &< \epsilon, & \forall i, j, k. \end{aligned}$$

Impossible for $SU(2)$!

Woronowicz (1987) : Family of $SU_q(2)$ homeomorphic but not isomorphic pseudogroups.

Algebraic context : **Quantum groups**.

Idea : $q \rightarrow 1$, $C(SU_q(2))$ goes to $C(S^3)$.

Podleś (1987) : quantum spheres S_q .

Plenty of deformations :

Hopf algebra and their representations
Differential calculi

Can NCG be useful ?

$SU_q(2)$

After many attempts (... , CHAKRABORTY-PAL,...),
DABROWSKI-LANDI-SITARZ-van SUIJLEKOM-VARILLY

$$0 < q < 1$$

$\mathcal{A} := \mathcal{A}(SU_q(2))$: Polynomials in a, a^*, b, b^*

$$ba = q ab, \quad b^* a = q ab^*, \quad bb^* = b^* b, \quad a^* a + q^2 b^* b = 1, \quad aa^* + bb^* = 1,$$

$$U = \begin{pmatrix} a & b \\ -qb^* & a^* \end{pmatrix} \text{ is unitary.}$$

Representations : $\text{Rep } SU_q(2) \simeq \text{Rep } SU(2)$.

Thus spherical harmonics and spin representations :

Hilbert space $\mathcal{H} = \mathcal{H}^\uparrow \oplus \mathcal{H}^\downarrow$

$|j\mu n^\uparrow\rangle$ with $j = 0, \frac{1}{2}, 1, \dots, \mu = -j, \dots, j$ and $n = -j^+, \dots, j^+$

$|j\mu n^\downarrow\rangle$ for $j = \frac{1}{2}, 1, \dots, \mu = -j, \dots, j$ and $n = -j^-, \dots, j^-$

here $x^\pm := x \pm \frac{1}{2}$

$$|j\mu n\rangle\rangle := \begin{pmatrix} |j\mu n^\uparrow\rangle \\ |j\mu n^\downarrow\rangle \end{pmatrix}$$

Little asymmetry : $|0, \mu, n, \downarrow\rangle = |j, \mu, \pm(j + \frac{1}{2}), \downarrow\rangle = 0$

Dirac operator \mathcal{D} : Chosen to get equivariance of spectral triple for left + right action of $\mathcal{U}_q(su(2))$: **usual Dirac on S^3** with round metric and same spectrum :

$$\mathcal{D} |j\mu n\rangle\rangle := \begin{pmatrix} 2j+\frac{3}{2} & 0 \\ 0 & -2j-\frac{1}{2} \end{pmatrix} |j\mu n\rangle\rangle.$$

Reality operator J

$$J |j, \mu, n, \uparrow\rangle := i^{2(2j+\mu+n)} |j, -\mu, -n, \uparrow\rangle, \quad J |j, \mu, n, \downarrow\rangle := i^{2(2j-\mu-n)} |j, -\mu, -n, \downarrow\rangle$$

thus it satisfies $J^{-1} = -J = J^*$ and $\mathcal{D}J = J\mathcal{D}$.

Remark : For modular conjugation J of Tomita, then $\mathcal{A}(SU_q(2))^\circ \simeq \mathcal{A}(SU_{\frac{1}{q}}(2))$

so \mathcal{D} equivariant under $\mathcal{U}_{\frac{1}{q}}(su(2))$ as well, so \mathcal{D} is a scalar : no-go result (no 3^+ -summable spectral triple on $SU_q(2)$ for modular J .)

Remarks on representations

$$\pi(a) |j\mu n\rangle\rangle = \alpha_{j\mu n}^+ |j^+ \mu^+ n^+\rangle\rangle + \alpha_{j\mu n}^- |j^- \mu^+ n^+\rangle\rangle$$

$$\alpha_{j\mu n}^+ = \sqrt{q^{\mu+n-\frac{1}{2}}} \sqrt{[j+\mu+1]} \begin{pmatrix} q^{-j-\frac{1}{2}} \frac{\sqrt{[j+n+\frac{3}{2}]}}{[2j+2]} & 0 \\ q^{\frac{1}{2}} \frac{\sqrt{[j-n+\frac{1}{2}]}}{[2j+1][2j+2]} & q^{-j} \frac{\sqrt{[j+n+\frac{1}{2}]}}{[2j+1]} \end{pmatrix}$$

with $[x] := \frac{q^x - q^{-x}}{q - q^{-1}}$.

Similar relations for $\alpha_{j\mu n}^-$ and b, a^*, b^* .

Off-diagonal terms : $\alpha_{j\mu n \uparrow \downarrow}^+ = \mathcal{O}(q^{2j+1})$, $\alpha_{j\mu n \uparrow \downarrow}^- = \mathcal{O}(q^{2j})$.

$L_q |j\mu n\rangle\rangle := q^j |j\mu n\rangle\rangle$, \mathcal{K}_q ideal generated by L_q .

Result : $\mathcal{K}_q \subset OP^{-\infty}$ and for $\underline{\pi} := \pi \bmod \mathcal{K}_q$ all off diagonals disappear and $\underline{\pi}$ is a representation of $\mathcal{A} \bmod \mathcal{K}_q$.

Under f no difference between π and $\underline{\pi}$.

$(\mathcal{A}, \mathcal{D}, \mathcal{H})$ is a regular spectral triple up to

commutant property : $[\pi(a), J\pi(b)J^{-1}] \in \mathcal{K}_q$

first order condition : $[[\mathcal{D}, \pi(a)], J\pi(b)J^{-1}] \in \mathcal{K}_q$.

Definition :

$$\begin{aligned} \underline{\pi}(a) &:= a_+ + a_-, & \underline{\pi}(b) &:= b_+ + b_- \\ a_+ |j\mu n\rangle\rangle &:= q_{j^++\mu^+} \begin{pmatrix} q_{j^++n^++1} & 0 \\ 0 & q_{j^++n^+} \end{pmatrix} |j^+ \mu^+ n^+\rangle\rangle, \\ a_- |j\mu n\rangle\rangle &:= q^{2j+\mu+n+\frac{1}{2}} \begin{pmatrix} q & 0 \\ 0 & 1 \end{pmatrix} |j^- \mu^+ n^+\rangle\rangle, \\ b_+ |j\mu n\rangle\rangle &:= q^{j+n-\frac{1}{2}} q_{j^++\mu^+} \begin{pmatrix} q & 0 \\ 0 & 1 \end{pmatrix} |j^+ \mu^+ n^-\rangle\rangle, \\ b_- |j\mu n\rangle\rangle &:= -q^{j+\mu} \begin{pmatrix} q_{j^++n^+} & 0 \\ 0 & q_{j^--n^+} \end{pmatrix} |j^- \mu^+ n^-\rangle\rangle. \end{aligned}$$

where $q_x := \sqrt{1 - q^{2x}}$.

Grading : Due to the shift $j \rightarrow j^\pm$:

Degree 1 : a_+, b_+, a_*, b_* , Degree -1 : a_-, b_-, a_+^*, b_+^* .

If $X := *$ -algebra $\{a_\pm, b_\pm\}$, $T \in X$,

$T^0 := 0$ -degree part of T for this grading.

2 other representations : On the basis $\{\varepsilon_n : n \in \mathbb{Z}\}$ of $\ell^2(\mathbb{Z})$

$$\pi_{\pm}(a)\varepsilon_n := q_{n+1}\varepsilon_{n+1}, \quad \pi_{\pm}(b)\varepsilon_n := \pm q^n \varepsilon_n.$$

\mathcal{A} is a Hopf- $*$ -algebra for a certain coproduct :

$$*\text{-homomorphism } r : X \rightarrow \pi_+(\mathcal{A}) \otimes \pi_-(\mathcal{A})$$

$$\begin{aligned} r(a_+) &:= \pi_+(a) \otimes \pi_-(a), & r(a_-) &:= -q \pi_+(b) \otimes \pi_-(b^*), \\ r(b_+) &:= -\pi_+(a) \otimes \pi_-(b), & r(b_-) &:= -\pi_+(b) \otimes \pi_-(a^*). \end{aligned}$$

Symbol map : $*$ -homomorphism $\sigma : \pi_{\pm}(\mathcal{A}) \rightarrow C^\infty(S^1)$ defined for $z \in S^1$ on the generators by

$$\sigma(\pi_{\pm}(a))(z) := z, \quad \sigma(\pi_{\pm}(b))(z) = 0.$$

Noncommutative integrals : $\int T := \operatorname{Res}_{s=0} \zeta_D^T(s)$ where $\zeta_D^T(s) := \operatorname{Tr}(T|\mathcal{D}|^{-s})$.

Theorem (DLSvSV) : **The dimension spectrum of $(\mathcal{A}(SU_q(2)), \mathcal{H}, D)$ is $\{1, 2, 3\}$. Its KO-dimension is 3.** Moreover, for $T \in$ algebra $\{\delta^k(\pi(\mathcal{A})) : k \in \mathbb{N}\}$

$$\int T|\mathcal{D}|^{-3} = 2(\tau_1 \otimes \tau_1)(r(T)^\circ),$$

$$\int T|\mathcal{D}|^{-2} = 2(\tau_1 \otimes \tau_0 + \tau_0 \otimes \tau_1)(r(T)^\circ),$$

$$\int T|\mathcal{D}|^{-1} = (2\tau_0 \otimes \tau_0 - \frac{1}{2}\tau_1 \otimes \tau_1)(r(T)^\circ),$$

$$\int F T|\mathcal{D}|^{-3} = 0, \quad \int F T|\mathcal{D}|^{-2} = 0,$$

$$\int F T|\mathcal{D}|^{-1} = (\tau_0 \otimes \tau_1 - \tau_1 \otimes \tau_0)(r(T)^\circ),$$

with for $x \in \pi_\pm(\mathcal{A})$, $\tau_0(x) := \lim_{N \rightarrow \infty} (\text{Tr}_N x - (N+1)\tau_1(x))$,
 $\tau_1(x) := \frac{1}{2\pi} \int_0^{2\pi} \sigma(x)(e^{i\theta}) d\theta$, and $\text{Tr}_N x = \sum_{n=0}^N \langle \varepsilon_n, x \varepsilon_n \rangle$.

Computation of spectral action of $SU_q(2)$

$$S(\mathcal{D}_A, \Phi, \Lambda) = \sum_{1 \leq k \leq 3} \Phi_k \Lambda^k \int |D_A|^{-k} + \Phi(0) \zeta_{D_A}(0), \quad (2)$$

$$\Phi_k = \frac{1}{2} \int_0^\infty \Phi(t) t^{k/2-1} dt.$$

Only 4 terms!

Totally different from commutative case of S^3 : terms in $\Lambda^3, \Lambda^1, \Lambda^{-1}, \Lambda^{-3}, \dots$

Conclusion : no way to compare spectral action when $q \rightarrow 1$!

Tadpole : $\int AD^{-1} \neq 0$.

$$\int a[D, a^*]D^{-1} = \frac{q^2+3}{2(q^2-1)}, \quad \int a^*[D, a]D^{-1} = \frac{3q^2-1}{2(q^2-1)}.$$

No tadpole on S^3 !

Top degree in (2) : $\int |D_A|^{-3} = \int |D| = 2, \forall A \in \Omega^1(\mathcal{A})$ (general property.)

Computation of spectral action of $SU_q(2)$

Full computations of spectral action has been obtained for any A .

$$\int |D_{\mathbb{A}}|^{-3} = 2,$$

$$\int |D_{\mathbb{A}}|^{-2} = -8 T_a(A),$$

$$\int |D_{\mathbb{A}}|^{-1} = -\frac{1}{2} + 4 (T_a(A^2) + T_a^2(A) - T(A)),$$

$\zeta_{D_{\mathbb{A}}}(0) = P_L(A) + P_Q(A) + P_C(A)$ where

$$P_L(A) = -4 TP(A) + T_a(A),$$

$$P_Q(A) = 2 T(A^2) + 4 T_a(A)(T(A) - T_a(A^2)),$$

$$P_C(A) = -\frac{4}{3} T_a(A^3).$$

Computation of spectral action of $SU_q(2)$

$$\mathcal{S}(\mathcal{D}_{a^* da}, \Phi, \Lambda) = 2 \Phi_3 \Lambda^3 - 8 \Phi_2 \Lambda^2 + \left(-\frac{1}{2} + \frac{8}{1-q^2}\right) \Phi_1 \Lambda^1 + \left(\frac{4q^4}{1-q^4} - \frac{12q^2}{1-q^2} - \frac{13}{3}\right) \Phi(0).$$

Depends on q !
Has pole at roots of unity!

Main difficulty : algebraic use of the basis !

Differential calculus on $SU_q(2)$

Remarkable 1-form :

$$\pi(a^*) d\pi(a) + q^2 \pi(b) d\pi(b^*) + q^2 \pi(a) d\pi(a^*) + q^2 \pi(b^*) d\pi(b) = \xi(\mathcal{D}),$$

where $\xi(s) = q \frac{[2s]-2s}{[s+\frac{1}{2}][s-\frac{1}{2}]}$.

In the $q = 0$ limit, this is exactly $F = \text{sign}(\mathcal{D})$.

$$F = \frac{1}{1-q^2} (\pi(a^*) d\pi(a) + q^2 \pi(b) d\pi(b^*) + q^2 \pi(a) d\pi(a^*) + q^2 \pi(b^*) d\pi(b)),$$

Since $[F, \pi(\mathcal{A})] = 0$, F is a central one-form up to $OP^{-\infty}$.

But : The order one-calculus is not universal (up to $OP^{-\infty}$).

F is not closed since, forgetting π ,

$$da^* da + q^2 da da^* + q^2 db^* db + q^2 db db^* = -(1 + q^2).$$

Differential calculus on $SU_q(2)$

Idea : to work modulo some ideal :

Let Ψ_0^0 the algebra $\{ \delta^k(\pi(\mathcal{A})) \text{ and } \delta^k([\mathcal{D}, \pi(\mathcal{A})]) , k \in \mathbb{N} \}$.

\exists pseudodifferential operators T of order ≤ 0 such that

$$\begin{aligned} \int T T' |D|^{-2} &= \int T' T |D|^{-2} = \int T T' |D|^{-3} = \int T' T |D|^{-3} \\ &= 0, \quad \forall T' \in \Psi_0^0(\mathcal{A}). \end{aligned} \tag{3}$$

In fact, if $R = *$ -ideal generated by $\{ a_-, b_- b_+, b_- b_+^* \}$

$\mathcal{R} = R + RF$ is a $*$ -ideal in $\Psi^0(\mathcal{A})$ satisfies (2) and invariant by F, d .

Up to \mathcal{R} ,

$$\begin{aligned} a da &\simeq da a, & a^* da &\simeq -da^* a, & b da &\simeq q da b, \\ b^* da &\simeq q da b^*, & a da^* &\simeq -da a^*, & \dots \end{aligned}$$

Any selfadjoint one-form A can be presented as :

$$A \simeq x da - da^* x^* + y db - db^* y^* \text{ with } x, y \in \mathcal{A}.$$

This reduces computations

Differential calculus on $SU_q(2)$

Open question for higher forms :

What is the junk?

$$\mathcal{J} := \left\{ \sum_i d\pi(x_i) d\pi(y_i) : \sum_i \pi(x_i) d\pi(y_i) = 0, x_i, y_i \in \mathcal{A} \right\}$$

necessary to compute 2-forms

$$\Omega_{\mathcal{D}}^2(\mathcal{A}) := \left\{ \sum_i d\pi(x_i) d\pi(y_i) : x_i, y_i \in \mathcal{A} \right\} / \mathcal{J}.$$

Idea : A "nice" Dirac operator should select a "nice" differential calculus.

Conclusion and perspectives

Difficulty to compare : wall between classical and quantum $SU(2)$.

Spectral action has rather peculiar properties.

Podleś spheres S_q : subalgebras of $SU_q(2)$ and $S_q \simeq SU_q(2) / U(1)$.

Some uniqueness of the differential calculus exists in some cases.

Quantum field theory on these triples will be too poor!

Generalization to 4-dimensional quantum Euclidean sphere S_q^4
(D'ANDREA-DABROWSKI-LANDI) : isospectral deformation of S^4 with $U_q(\mathfrak{so}(5))$ -invariance.

Interest : canonical instanton bundle on S_q^4 .

Towards $SU_q(2)$ -instantons on S_q^4 .
