Insight

- It's a perspective image of a 3-d object: "9 parallel race tracks"
- To the right, they go over a sort-of normally shaped hill,
- viewpoint is close from above
- To the left they flatten out, then they curve back and recede into the distance
- Let's draw the 18 strip-edges in 3d

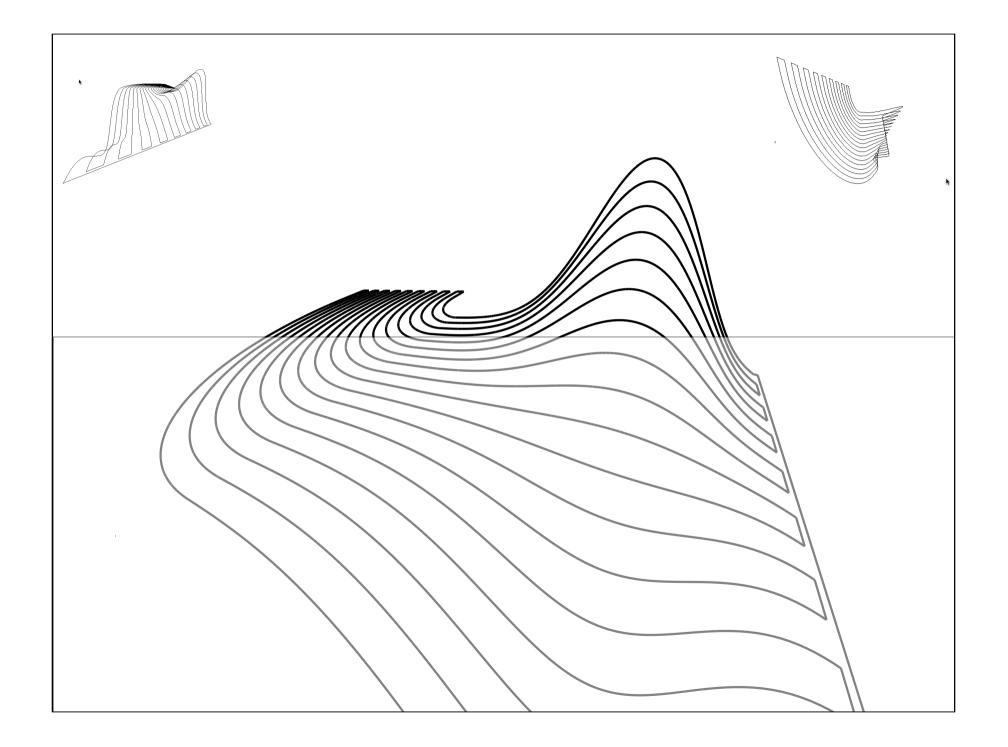

Live Demo

(download and run in R)

- Try it out: R script <u>http://www.math.leidenuniv.nl/~gill/3dlogo.txt</u>
- **rgl** package creates one rotatable 3d closed curve
- Earlier version had 9 black strips obtained by drawing many lines connecting opposite sides
- Earlier version had more simple code and more beautiful object but not so close to desired end result
- I'm a bad programmer so I don't have it any more (but I could easily make it again)

Postprocessing

- Fill the 9 strips for final scalable image: Export rgl image to svg, "ungroup" object & "join" many, many(!) pieces to one closed line in *Illustrator*. Save as postscript, fill closed line. Convert to svg or pdf or (nonscalable) jpeg ...
- There <u>must</u> be an easy way to end up with **nine** scalable **filled closed curves**
- <u>Must make R description shorter while still fitting</u> data (front view: half a straight onion)
- I'll give a prize to the person who can do this

- I later asked Tobias Baanders what the idea had been for his design
 - Answer: he had 3-d perspective image in mind
- Long ago (when I was <u>richard@mcvax.nl</u>)
 I once had the following Unix *motd*:
 "life is like an onion: you peel off layer after layer only to find there's nothing inside"
 - My philosophy: it's between the layers where you find the meaning of life

End of part l

Postscript to Part I

- Finally, my "solution" does not use statistics much, and why should it? We can now create more beautiful logos, and all kinds of variant logos
- Try again with Sage, <u>http://www.sagemath.org</u>/ Free open source mathematics system, combining existing open-source packages into a common Python-based interface, slowly becoming a viable alternative to Magma, Maple, Mathematica and Matlab
- Sage has interfaces to R and LaTeX

Part 2: R on iOS ?

Sure, thanks to ech0chrome

- http://leafmoon.users.sourceforge.net/cydia/
- http://twitter.com/#<u>!/ech0chrome</u>
- Taiju Yamada <<u>ech0chrome@104.net</u>>

R on iOS

- First *jailbreak* iDevice gain root priviledges and circumvent Apple restrictions (your legal right)
- Jailbreak restores hidden functionality and installs Cydia (App Store for lots more)
- Apple doesn't (yet) see difference & device can be restored to original state no loss of warranty

Why jailbreak an iThing?

- iPhone, iPad speed, memory, storage, monitor (smaller pixels!) of typical 10 years old desktop, plus...
 - Internal *mobile* internet modem (3G cell phone)
 - Bluetooth, Wireless, USB connections...
 - Gorgeous GUI on top of a (BSD) UNIX
- Apple treats you like a child
- Why climb Everest? Because it's there

Jailbreaking

- On <u>earlier</u> iDevices and even latest iOS not difficult or risky (but make a backup first!).
 - Run greenp0ison / redsn0w / limeraln on Mac or PC with iTunes, connected by USB
 - Uses known CPU architecture & vulnerabilities in Apple's boot process
- <u>Alas</u>, iPad2 and iPhone 4S have new secret Apple CPU
 - Only known jailbreak exploits bug in pdf display fixed *above* iOS 4.3.3
 - *Down*grading your currently installed iOS is impossible

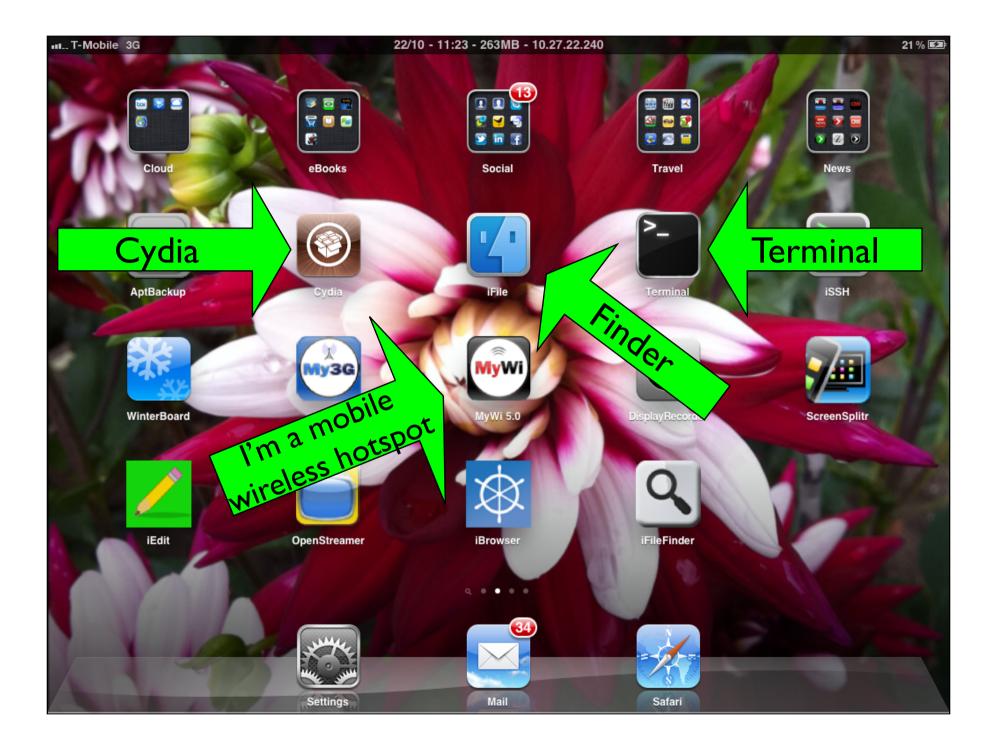

Jailbreaking iPad2, iOS 4.3.3

- Safari to Comex's <u>http://www.jailbreakme.com</u>
- Install-button is a link to a pdf file which Safari tries to view, crashing iOS
- In ensuing chaos, Cydia etc. is installed (from the "pdf" file)
- Install OpenSSH and change passwords (*alpine*) of <u>root</u> and of user (<u>mobile</u>)
- Install Comex' patch of the pdf bug from Cydia
- Don't upgrade iOS jailbreak lost, no going back

echo0chrome's R depends on several packages from his repository Add this repo to your Cydia repo-list to install all dependencies automatically

Problem: R wants **jpeg** aka **libjpeg** for plot to .jpg file (so what: plot to pdf) ech0chrome's R wants his v.7; some Cydia apps want Cydia's v.6. Work-around: enable repo, install dependencies (except libjpeg) by Cydia Download ech0chrome's R-installer, install R from terminal with --force-depends (overrides dependency failures)

Jailbreak enables download of arbitrary files by Safari & from mail attachments by Mail – both disabled by Apple! Have fun!

- Now we wait for LaTeX on iOS
- Remember to change the passwords of **root** and of **mobile** from **alpine** to ...
- Be prepared for annoyance as Apple, hackers, play cat and mouse
- Beware of scams and rumours, don't pay anyone anything!
- Don't count on jailbreak still being possible a few models / iOS versions later

Postscript to Part 2

- iPad2, iPhone 4S (iOS 5.0.1) have jailbreak:
 "Absinthe"
- It's (usually) fast and easy (do it alongside a good cup of coffee, relax)

 Do before release of next revision of iOS: Apple only allows "Restore" to *latest version* of iOS

Postscript to Part 2 (continued)

- <u>http://gamma-level.com/iphoneos/ports/texlive</u> (Aaron Griffith) provides Cydia-based install of LaTeX
 - Just needs *Perl* from <u>http://coredev.nl/</u>
 - iOS hard disk has small partition for system, large partition for user. But you can move, symlink /usr/local (system partition) to /private/var/local (user partition), see <u>http://coredev.nl/</u>
- Griffith also explains how to make your own build, could be useful for learning how to add Sage, ... !

Update 3 July 2012

- Now at iOS 5.1.1: jailbreak with redsn0w or absinthe
- R installation problem with "jpeg" incompatibility no longer exists
- New R incompatibility problem with "TruPrint" (v. useful Cydia app: print to pdf); solution, install R first, then TruPrint)
- LaTeX installs fine, note: TruPrint already moves and sim-links "local" to user partition. So if you have TruPrint, you can omit this step.
- After installation, the LaTeX executables need to be "signed". Aaron Griffiths: "iOS 5 is a little bit more strict about what executables it will run than older versions. The fix is pretty easy but I haven't had a chance to release a new version of my LaTeX packages. I've heard of this problem a few times now, so I've written a script which will pseudo-sign all the LaTeX executables so that they will run again. You'll need a tool called `ldid` to run this script; either install it through Cydia or run "apt-get install Idid" as root. Then download this script, and run it (also as root) <u>http://gammalevel.com/forever/pseudosign-latex.sh</u>. This script simply runs `ldid -S ...` on each LaTeX executable, which you could do manually if you want. There's a lot of them though, so the script is much more convenient.
